

Project Title:

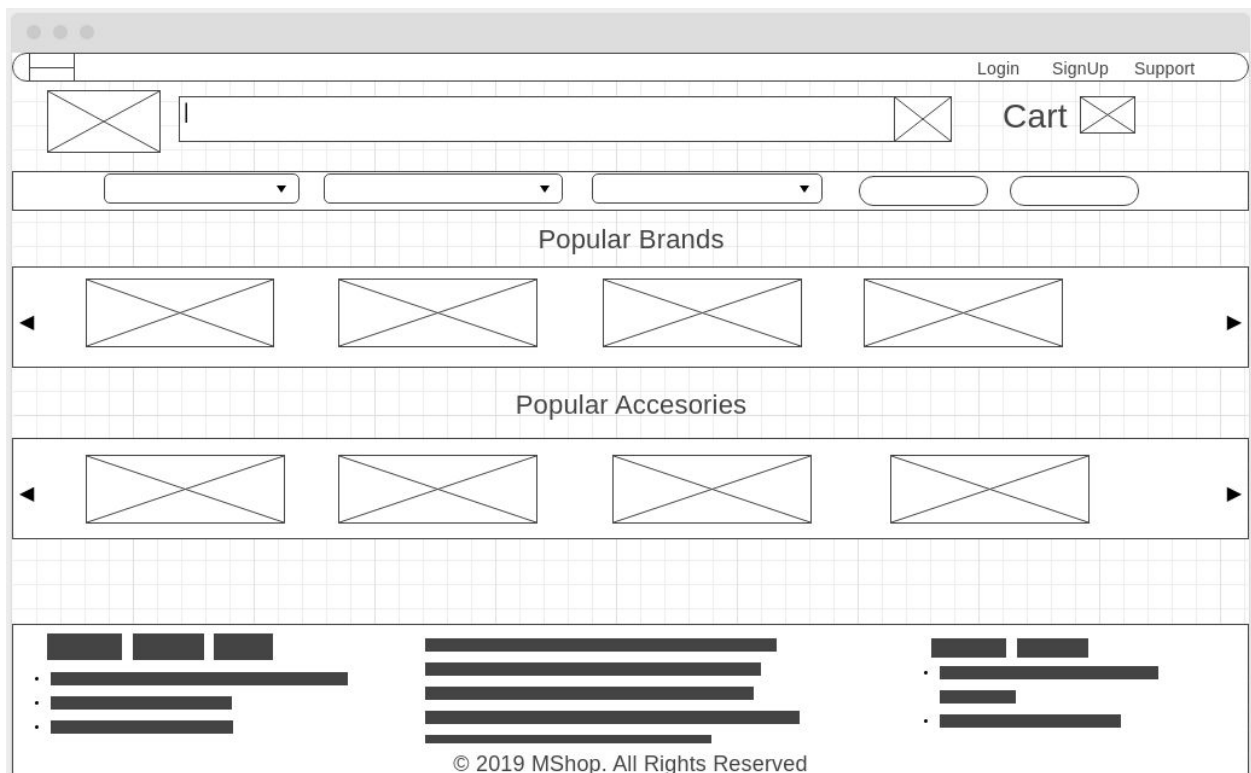

MShop Online Store

Introduction:

This website is a vehicle engine utilities and oil buying and selling platform which provides an easy interface for both customers and the shop owner. The goal of this website is to make engine utilities and oil shopping a delightful experience from both ends.

An easy to use interface along with a user-friendly cart and checkout system for customers and user interface for the administrator who will be the retailer to add or remove products along with product categories will be added as the main feature of this website.

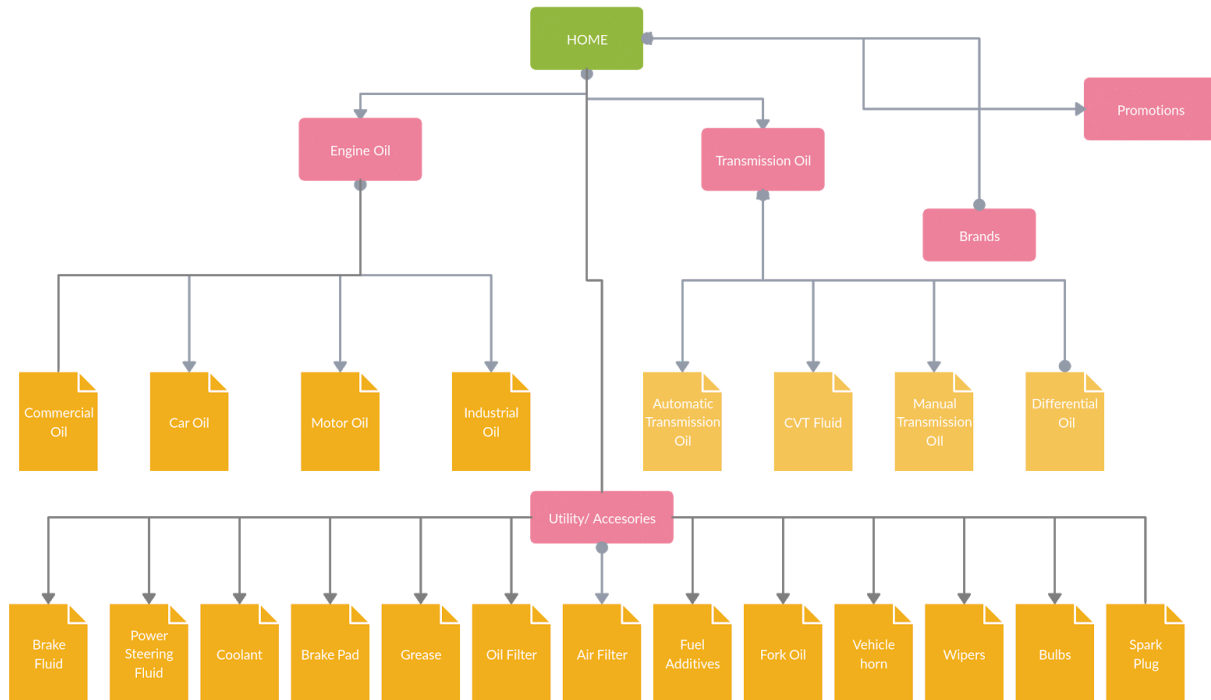

User Interface design and prototype:

People want the most popular items in front of them first. So, the most popular brands and top selling items will be in front of the user first so that the user doesn't even need to search for that product. Besides, there is a search bar and a navigation bar on top. Thus, the user will be able to find his/her desired products easily.

Navigation Structure:

Navigation bar will be located under the search bar in the desktop view and will be responsive to the mobile view. In mobile view it will go to the top left corner of the bar where login and signup is located. The navigation bar consists of 3 drop down menus and 2 reference links. Every page will have the same header and navigation bar. So, the user will be able to go to any desired page from any page he/she is currently at.
